What the columns mean

- **Waiver claims made** — how many you put in across a season, the ones you lost included.
- **Points per FAAB dollar** — points a claimed player scored *while in your starting lineup*, divided by what you paid. Points he scored on your bench do not count.
- **Overpaid on won bids** — how far above the *next-highest* bid you landed on a contested claim. Money you did not have to spend.
- **Busts in rounds 1–4** — picks returning at least 50 points less than that draft slot normally does.
- **Started the right players** — the share of your best possible lineup you actually started, judged after the fact.

What any of it is worth

Fitted against season win totals across 56 manager-seasons, then checked by leaving each season out and predicting it.

- Busting a pick in the first four rounds costs about **one win** — by some distance the most expensive thing here. Ten extra waiver claims are worth roughly a tenth of a win.
- But all five together sharpen a guess at a manager's record only from **±2.1 wins to ±2.0**. They account for 8% of a season; the other 92% is schedule, injuries and luck.

Managers with fewer than three seasons are not ranked — one year is far too noisy to place anyone.
